## Predictive Services Discussion

**Winds will continue over the Great Basin, southeast Montana and Wyoming today. Rain and mountain snow are expected over much of the Northwest, Idaho, Montana and Wyoming through Saturday.** A strong upper low over the Northwest will bring cold, wet weather to much of the northwest quarter of the country the next few days. This system will bring cooler weather to California today and Friday with gusty winds in the mountains. Dry, gusty offshore winds are expected in California Sunday and Monday. Another system will bring more precipitation to the Northwest and Northern Rockies early next week.

### **EXTREME FIRE BEHAVIOR (continued)**

Extreme fire behavior has always been present in cases of shelter deployment. It is critical for firefighters to maintain situational awareness of live and dead fuel moisture conditions as well as predicted and current weather conditions. As fire behavior changes, it is critical to act decisively to the changing situation.

- Discuss how the following factors can contribute or lead to extreme fire behavior:
  - Frost Kill: Has there been a late or unusually extensive freeze? Is the loading of frost-killed fuels high?
  - Drought Conditions: Live Fuel Moistures Index, KBDI, Soil Moisture Index, low humidity, high temperatures
  - Slope: Increases fire spread uphill, preheats fuels by convection, may channel winds
  - Sea Breeze/Foehn: Wind direction may vary throughout the day, humidity changes may occur, strong wind velocities may drive fire behavior to extremes.
  
- To aid situational awareness, track NFDRS live and dead fuel moisture outputs.
  
- Take hourly weather observations and track the hourly changes. By tracking fuel moisture and weather observations and using "Table 74: Fire Severity Related to Fuel Moisture Chart," firefighters can be alerted to those conditions that can lead to situations where there is a high potential for extreme fire behavior.
